Queensland the Smart State

scopic version 1

Decision support software providing seasonal climate outlooks for climate-sensitive industries in the Pacific Island Countries.

SCOPIC (Seasonal Climate Outlooks for Pacific Island Countries) has been developed as part of the AusAID-funded project "Enhanced Application of Climate Predictions in Pacific Island Countries". The aim of this project is to enable Pacific Island National Meteorological Services to provide timely seasonal prediction services to people in climate sensitive industries. The project is implemented in the Cook Islands, Fiji, Kiribati, Niue, Papua New Guinea, Samoa, Solomon Islands, Tonga, Tuvalu, and Vanuatu.

Exploration
Highly graphical time series and statistical analyses allow exploration of agri-climatic variables such as sea-surface temperatures, Southern Oscillation indices, and rainfall. Analyses include scatter-plots and monthly/yearly summary statistics.

Prediction
SCOPIC uses built-in discrimination-analysis algorithms to generate seasonal outlooks in "above" or "below median" formats. Results are presented graphically in the form of "chocolate wheels", as well as in tabular and report formats.

Evaluation
Temporal and spatial evaluation of forecasting skill is available through advanced skill-scale and "hindcast" analyses. Skill can be assessed for different periods of the year and forecast lead-times. Individual "hindcast" results can be reviewed on a year-by-year basis.

Reporting
Generate "rich-text" reports using pre-configured XSLT templates, customisable for each country. The reports provide a descriptive summary of the outlooks, and update automatically with program changes. The reports can then be edited, saved and printed.

Conclusions

- In the Pacific Islands drought warning events leading to drought are highly correlated during ENSO events.
- This has application in developing a drought early warning system for the Pacific Island Countries.
- Due to direct impact of drought on water, agriculture, health and renewable energy sectors, a drought early warning system could assist in mitigation of adverse impacts in the most vulnerable countries.
